► **Medical Marijuana, Nausea and Vomiting by ONLINE POT - 5/23/01 | 1. What research has been done and what is known about the possible medical uses of marijuana? There is a large body of clinical research on the use of cannabinoids for chemotherapy-related nausea and vomiting. Most of this work was conducted during the early 1980s. The majority of reports deal with oral dronabinol rather than smoked marijuana. These studies demonstrated that dronabinol was superior to placebo in controlling nausea and vomiting caused by chemotherapy that induces a moderate amount of emesis (Sallan et al. 1975). Several studies compared oral dronabinol with prochlorperazine (Sallan et al. 1980). Mixed results were reported from these studies, but**

generally dronabinol was found equivalent. Visit -

▶ **Medicinal Uses of Marijuana: Nausea, Emesis and Appetite Stimulation, by Drug Policy Alliance (DPA) | Drug Policy Alliance Network's work to promote drug policies based on science, compassion, health, and human rights. Excerpts from the American Public Health Association (APHA) amicus brief in Conant v. McCaffrey, (2001 filing): Marijuana is effective in treating nausea, anorexia and wasting. Nausea, anorexia, and wasting are common symptoms of many cancers and AIDS.(36) These symptoms are also the common adverse side effects of chemotherapy and other aggressive therapies used to treat those diseases and associated pain.(37) While other antiemetics are available, not all patients respond to these therapies.(38) Marijuana can provide critical relief for persons suffering from acute or chronic nausea and vomiting who do not respond to conventional therapies.(39) Click > [here](#) < for more.**

▶ **Medical Marijuana for Pain and Depression by Disabled World | Disabled World News covers all types of disability and health conditions, plus offers unbiased reviews of many new assistive devices and living aids currently available to the disabled, baby boomers, and senior members of the community worldwide. Marijuana is one of the most beneficial and therapeutically active substances known to man. Medical Cannabis refers to the use of the drug cannabis as a physician-recommended herbal therapy, most notably as an antiemetic. Cannabis has been used for medicinal purposes for approximately 4,000 years. Writings from ancient India confirm that its psychoactive properties were recognized, and doctors used it for a variety of illnesses and ailments. These included a whole host of gastrointestinal disorders, insomnia, headaches and as a pain reliever frequently used in childbirth. Click > [here](#) < for more.**

▶ **Medimar Medical Cannabis Consultants & Confirmations - Welcome to our legal marijuana site | California's Proposition 215 was approved on November 5, 1996. Ever since, state-level criminal penalties have been removed on the use, possession and cultivation of marijuana by patients who possess a "written or oral recommendation" from their physician that he or she "would benefit from medical marijuana." Conditions typically covered by the law include but are not limited to: arthritis; Nausea; cancer; chronic pain; HIV or AIDS; epilepsy; migraine; and multiple sclerosis. They can help you get your recommendation for legal marijuana with no hassles! Offices in Downtown L.A., Orange County and San Diego. Visit - <http://www.medicalcannabisconsultants.com/>**

▶ **GENERAL INFORMATION by CMCR | Welcome to the University of California's Center for Medicinal Cannabis Research (CMCR). The purpose of the Center is to coordinate rigorous scientific studies to assess the safety and efficacy of cannabis and cannabis compounds for treating medical conditions. The Center**

coordinates and supports cannabis research throughout the State of California. Research will focus on the potential medicinal benefits of cannabis for diseases and conditions as specified by the National Academy of Sciences, Institute of Medicine Report (1999) and by the Workshop on the Medical Utility of Marijuana, National Institutes of Health (1997). The following diseases and conditions constitute areas of emphasis for current CMCR funding: · Severe appetite suppression, weight loss, and Nausea due to HIV infection and other medical conditions · Chronic pain, particularly neuropathic pain · Severe nausea and vomiting associated with cancer and its treatment · Severe muscle spasticity caused by diseases such as multiple sclerosis Visit - <http://www.cmcr.ucsd.edu/geninfo/index.htm>

▶ **The Hemp and Cannabis Foundation (THCf) is a non-profit organization that helps qualified medical marijuana patients inform and empower themselves to become legally protected. Under state law in Oregon, Washington, Colorado, California, Nevada, Montana, Hawaii and Michigan, the following conditions qualify for medical marijuana permits: Chronic Severe Pain, Glaucoma, Cancer, AIDS/HIV, Chronic Muscle Spasms, Multiple Sclerosis, GERD, Seizure Disorders, Crohn's Disease, Chronic Nausea, Nausea, Asthma, IBS, Hepatitis C, Parkinson's Disease, Arthritis, and many others. Marijuana is much safer, more effective and less costly than many medicinal alternatives currently in use.** The THCf host several clinics where doctors help patients obtain a permit for medical marijuana. Physicians are fully licensed, experienced, well informed and compassionate. Staff explains each state's unique program and helps patients locate community resources so they can best benefit from their state's medical cannabis law. ▶ **Medical cannabis | Canna Cafe (blog)** - Medical cannabis refers to the use of the drug cannabis as a physician ... reported significant or total relief from nausea and vomiting. ... Medical cannabis refers to the use of the drug cannabis as a physician-recommended herbal therapy, most notably as an antiemetic. There are many studies regarding the use of cannabis in a medicinal context. Cannabis was listed in the United States Pharmacopeia from 1850 until 1942. The United States federal government does not currently recognize any legitimate medical use, although there are currently seven patients receiving cannabis for their various illnesses through the Compassionate Investigational New Drug program that was closed to new patients by President George H. W. Bush. Francis L. Young, an administrative law judge with the US Drug Enforcement Agency, in 1988, declared that “in its natural form, (cannabis) is one of the safest therapeutically active substances known.” However, smoked cannabis is today not approved by the U.S. Food and Drug Administration (FDA) It has medicinal uses throughout recorded history of Homo sapiens. Specifically to the United States, it was used legally for medicinal use for many things including birth-giving, chronic pain, and some other known conditions before 1942, when its use was essentially outlawed from The Marihuana Tax Act of 1937. Currently in 12 states it is medically available to conditions it has been shown effective to treat through recent studies. Visit - <http://canna-cafe.com/medical-cannabis>

▶ **Medical Use Of Marijuana – by Canadian Mind Products (blog)** Nausea is one of the most difficult medical conditions to treat. For most people with chronic nausea, Gravol does not do much good at all, and ginger does little better. Stemetil sometimes works, though it puts you to sleep. THC is the only drug that offers any relief, and probably that is mainly through distraction. In other words, the disorientation of THC is a necessary side effect. People prefer smoking marijuana to

taking THC tablets because they can precisely control the dose. With tablets it is far too easy to overdose. Chronic nausea is so debilitating it leads to suicidal depression. Marijuana offers a tiny respite of elation to look forward to. This pleasurable side effect, that so upsets Puritanical Republicans, is necessary for it to function. Though there is some evidence that marijuana may suppress the immune system, it can have value for people with AIDS who are suffering from wasting. They have little energy to eat, they feel nauseous and the strong medications make all foods taste utterly disgusting. A friend of mine near death on heavy duty AIDS drugs said that all food tasted like diesel oil. Marijuana can stimulate the appetite. Visit - <http://mindprod.com/humanrights/marijuana.html>

▶ **Marijuana - Just say know! | It's very easy to find the truth about marijuana. Just go to amazon.com and type in "marijuana", and you'll see a long list of books. Pick one and read it! Before we condemn anyone to an unspeakable and hideous prison experience, don't we owe it to them to be sure they really deserve to be in prison. Please consider the possibility, everyone reading this, that you may be wrong about marijuana.** What may not be in any of those books yet are two remarkable recent discoveries:

1. Marijuana's active ingredients, the cannabinoids, shrink tumors and promote the necrosis of cancerous tissue, without harming normal tissue. You can check this one out on the web with a Google search using the words [marijuana cancer], and also try [marijuana "shrink tumors"]. ▶ **Cannabis News from Canna Zine | Cannabis use has a 4,000-year medical history, dating back to the early Chinese and Indian civilisations. In the early 1840s, William O'Shaughnessy , of the East India Trading Company , described experiments giving cannabis tinctures to patients suffering rheumatism, tetanus, rabies, infantile convulsions, cholera and delirium tremens - conditions that traditional Indian medical practitioners were already treating with cannabis. Success. He reported great**

success in treating rheumatism, and also noted that cannabis was a great anti-vomiting agent. Click > [here](#) < for more.

▶ **Pro: Marijuana use for chronic pain and nausea, by The LA Times | Smoked marijuana can bring relief to sufferers of neuropathic pain comparable to that of other painkiller drugs, some studies show. By Jill U. Adams, Special to The Times August 18, 2008. Medical marijuana use has a history stretching back thousands of years. In prebiblical times, the plant was used as medicinal tea in China, a stress antidote in India and a pain-reliever for earaches, childbirth and more throughout Asia, the Middle East and Africa. In recent decades, medical researchers have investigated marijuana's effects on various kinds of pain -- from damaged nerves in people with HIV, diabetes and spinal cord injury; from cancer; and from multiple sclerosis. Marijuana has also been hypothesized to help with nausea induced by chemotherapy and antiretroviral therapy, and with severe loss of appetite as seen in people with the AIDS wasting syndrome. Click > [here](#) < for more.**

▶ **Marijuana as Medicine, by Consumer Reports - May 1997 | Should marijuana be used as a medicine, as its advocates say? Or is it a dangerous drug of abuse that exposes users to brain damage and lung cancer? Last fall, voters in California and Arizona approved laws allowing patients to smoke marijuana for medical purposes with a doctor's recommendation. Other states are considering similar moves. And the influential New England Journal of Medicine has editorialized in favor of extending this policy nationwide. Federal health and drug-enforcement officials have reacted strongly to these initiatives. "Seeming to legalize marijuana for anything would give young people the wrong impression," says Sheryl Massaro, a spokeswoman for the National Institute on Drug Abuse. "That doesn't even seem to enter the minds of a lot of people who are promoting it for medical use." The debate over medical marijuana seems likely to continue for some time, caught up as it is in the larger question of how the nation should deal with recreational drug use and abuse. "It's a shame" that the debate is so polarized, says Harrison Pope, a Harvard University psychiatrist who studies marijuana. "Science should know more about this substance by now, considering how long it has been in use." While the debate continues, here is what is known about the health effects, both good and ill, of this controversial drug. Visit - <http://www.medmjscience.org/Pages/history/consumerreports.html>**

▶ **Common Sense for Drug Policy: Medical Marijuana Facts & News | ... in San Francisco to protest the DEA's raid on a local medical cannabis dispensary. According to ASA's news release: ... Medical Marijuana and College Campuses: A Colorado student has been hassled by University administration even though he has adhered to state medical marijuana laws. According to The Denver Post September 20, 2008 article, ("Student Fights CU Over Hazy Marijuana Law")**

"A University of Colorado at Boulder student who has a medical-marijuana card will be given his pot back by campus police Monday. CU officials relented when threatened with a lawsuit after campus police confiscated less than 2 ounces of pot from Edward Nicholson's dorm room, and officials threatened him with suspension. Nicholson, 20, said he was holding the drug for his 23-year-old brother, a chronic-pain sufferer. State law allows doctor-recommended marijuana use for those 'suffering from debilitating medical conditions.' Caregivers of patients must carry state-issued medical-marijuana cards. Nicholson is the cardholder because he says pot is easier to buy in Boulder than in Aurora, where his family lives." Visit - <http://www.csdp.org/news/news/medmar.htm>

▶ **Cannabis Has "Clear Medical Benefits" For HIV Patients, Study Says -- Smoked marijuana produces "substantial and comparable increases in food intake ... with little evidence of discomfort and no impairment of cognitive performance" June 28, 2007 - New York, NY, USA: by cannabisnews.com | New York, NY: Inhaling cannabis significantly increases daily caloric intake and body weight in HIV-positive patients, is well tolerated, and does not impair subjects' cognitive performance, according to clinical trial data to be published in the *Journal of Acquired Immune Deficiency Syndromes (JAIDS)*. Investigators at Columbia University in New York assessed the efficacy of inhaled cannabis and oral THC (Marinol) in a group of ten HIV-positive patients in a double-blind, placebo-controlled trial. All of the subjects participating in the study had prior experience using marijuana therapeutically and were taking at least two antiretroviral medications. Visit - <http://cannabisnews.com/news/23/thread23135.shtml>**

Cannabis as Medicine

▶ **Accepted Medical Use: Clinical Research By DrugScience.org | DrugScience.org is the homesite for the Cannabis Rescheduling Petition ... volunteers, smoked cannabis was effective in reducing nausea and vomiting, ... The 2002 Petition to Reschedule Cannabis (Marijuana): Results from clinical research demonstrate that both dronabinol and whole plant cannabis can offer a safe and effective treatment for the following illnesses: muscle spasms in multiple sclerosis, Tourette syndrome, chronic pain, nausea and vomiting in HIV/AIDS and cancer chemotherapy, loss of appetite from cancer, hyperactivity of the bladder in patients with multiple sclerosis and spinal cord injury, and dyskinesia caused by levodopa in Parkinson's disease. During the 1970's and 1980's, several states conducted research programs comparing smoked marijuana to oral forms of THC. Musty and Rossi reviewed the data from research programs in 6 states. The results from only one of these research programs had been published in peer-reviewed journals before 1995 (Vinciguerra et al. 1988). In their 2001 review, Musty and Rossi wrote: "Data were available on 748 patients who smoked marijuana prior to and/or after cancer chemotherapy and 345 patients who used the oral THC capsule. . . Patients who smoked marijuana experienced 70-100% relief from nausea and vomiting, while those who used the THC capsule experienced 76-88% relief. . . . On the**

basis of these studies, it appears that smoked marijuana can be a very successful treatment for nausea and vomiting following cancer chemotherapy. . . The development of smokeless inhalation devices could certainly reduce the potential harm from smoking marijuana.” (Musti & Rossi 2001) Visit - http://www.drugscience.org/amu/amu_clinical_research.html

▶ **Medical Info – by Americans for Safe Access (ASA) | Medical Cannabis Endorsements. Safe access to cannabis for patients and research has been endorsed by a growing number of professional healthcare organizations, including the American Public Health Association, the American Nurses Association, and most recently, the Medical Student Section of the American Medical Association.** Medical Marijuana Endorsements and Statements of Support. The following is a representative sample of the large number of government panels, medical organizations, health charities and individuals of note who have publicly stated their support for medical access to marijuana and/or their opposition to criminal penalties for medical marijuana users. " Nausea, appetite loss, pain and anxiety are all afflictions of wasting, and all can be mitigated by marijuana." - Institute of Medicine, "Marijuana and Medicine: Assessing the Science Base," 1999 Visit - <http://www.safeaccessnow.org/section.php?id=344>

▶ **Medical Marijuana Uses, by Concept420 | Below are just a small sample of the many uses of Medical Marijuana: Cancer Chemotherapy; The drugs used to treat cancer are among the most powerful, and most toxic, chemicals used in medicine. They kill both cancer cells and healthy cells, producing extremely unpleasant and dangerous side effects. The most common is days or weeks of vomiting, retching, and nausea after each treatment. The feeling of loss of control is highly depressing, and patients find it very difficult to eat anything, and lose weight and strength. People find it more and more difficult to sustain the will to live, and many chose to discontinue treatment, preferring death to treatment.** Cannabis can be used as an antiemetic, a drug which relieves nausea and allows patients to eat and live normally. It is safer, cheaper and often more effective than standard synthetic antiemetics. Smoking cannabis is more effective than taking it orally (or its synthetic derivatives such as Marinol) as patients find it difficult to keep anything down long enough for it to have an effect. Smoking cannabis produces an immediate effect, and patients find it easier to control the dosage. Additionally the euphoric properties act as an anti-depressant, and the hunger and enjoyment of food properties ('the munchies') make weight gain easy, and these increase the chances of recovery. Visit - http://www.concept420.com/marijuana_medical_med_uses.htm

▶ **Medical cannabis - Wikipedia, the free encyclopedia | Cannabis Indica (now referred to as Cannabis sativa subsp. indica),[1] Fluid Extract, American Druggists Syndicate, pre-1937** Medical cannabis refers to the use of the Cannabis plant as a physician-recommended herbal therapy as well as synthetic THC and cannabinoids. So far, the medical use of cannabis is legal only in a limited number of territories, including Canada, Belgium, Austria, the Netherlands, the United Kingdom, Spain, Israel, Finland, and some U.S. states. This usage generally requires a prescription, and

distribution is usually done within a framework defined by local laws. There are many studies regarding the use of cannabis in a medicinal context. Visit - http://en.wikipedia.org/wiki/Medical_cannabis

► **Medical Marijuana Information, from The Erowid Vault | Marijuana has many possible medical uses. Positive effects are claimed for ailments such as cancer, AIDS, and glaucoma. AIDS can cause a loss of appetite known as "wasting syndrome", which can lead to drastic weight loss and weakness. Chemotherapy used in the treatment of cancer causes nausea resulting in an inability to keep down food. Marijuana's healing nature for these two illnesses is a result of its ability to increase a person's appetite as well as relieving nausea, allowing a patient to regain weight. Marijuana reportedly helps glaucoma patients by reducing intraocular pressure that can cause damage to the eye. Visit - http://www.erowid.org/plants/cannabis/cannabis_medical.shtml**
